OMNeT++ COMMUNITY SUMMIT 2016

Outline

- Introduction to WiFi-Direct
- 802.11 in INET Framework
- WiFi-Direct Implementation
- Validation Tests
- Conclusion and perspectives

Introduction

- WiFi-Direct is a new operation mode in Wi-Fi networks

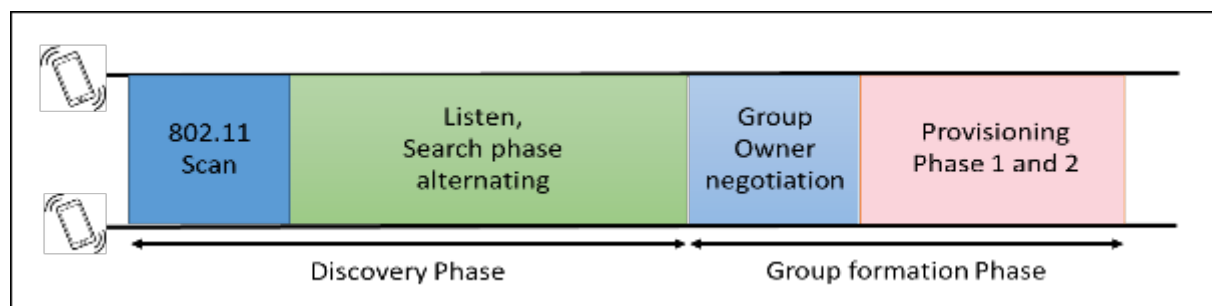

Wi-Fi Direct applications

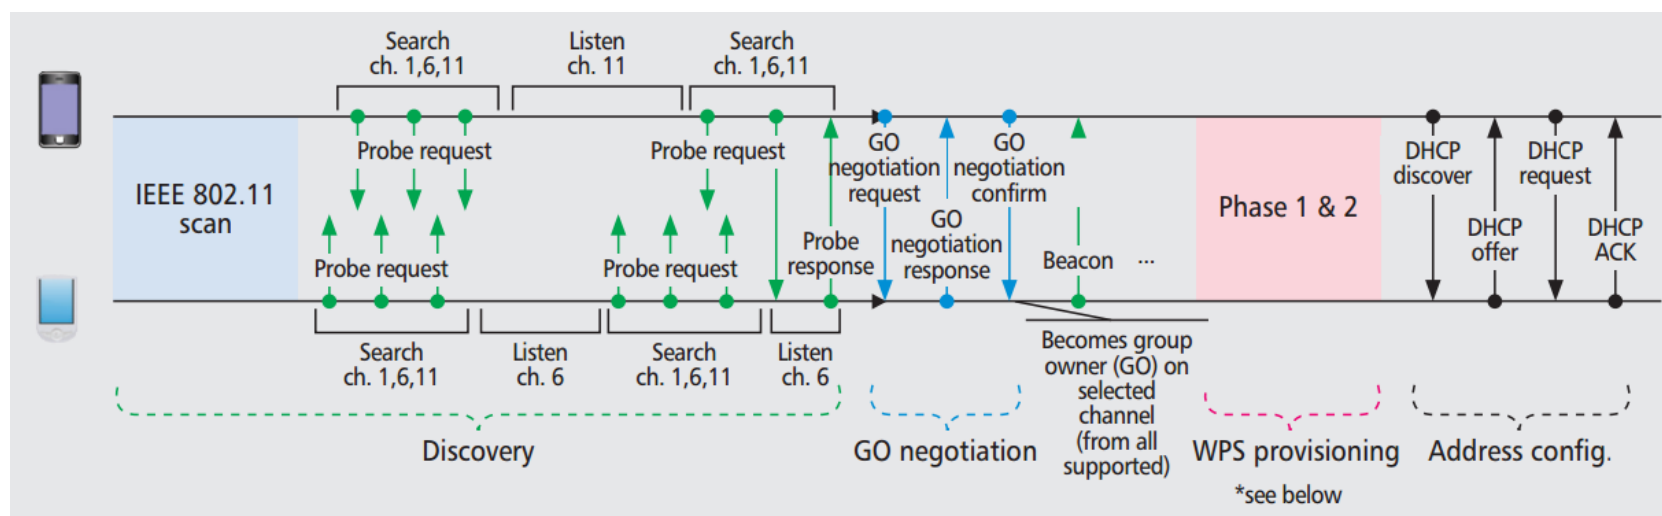

- File exchange between smartphones
- WiFi-Direct based Device-to-device transmission in dense wireless networks

Group formation

- 3 cases
 - Standard
 - Autonomous
 - Persistent

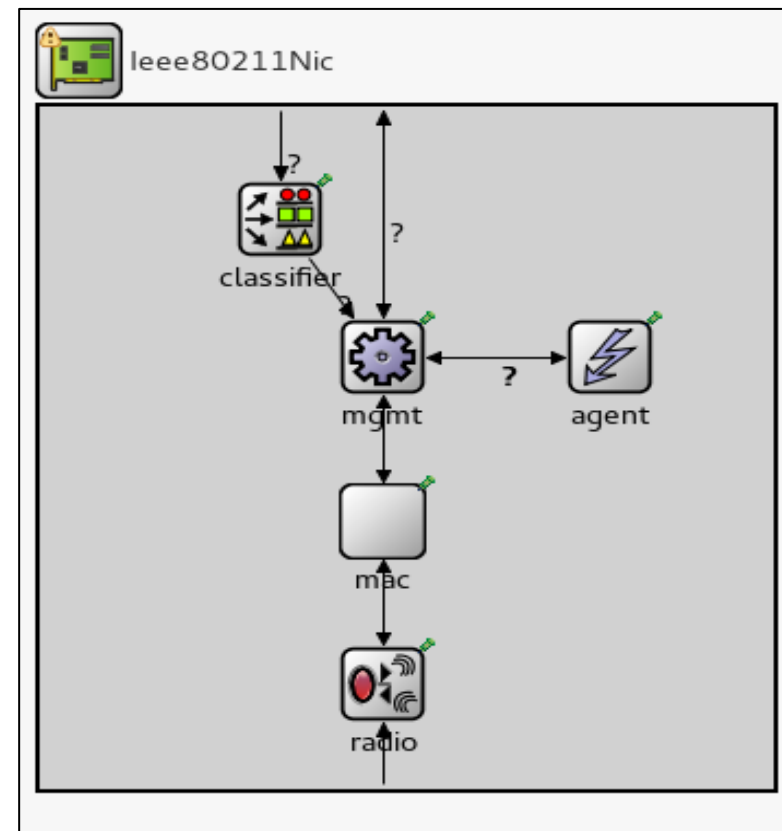

GO Negotiation

- Device declaring the highest *GO Intent* value becomes P2P GO

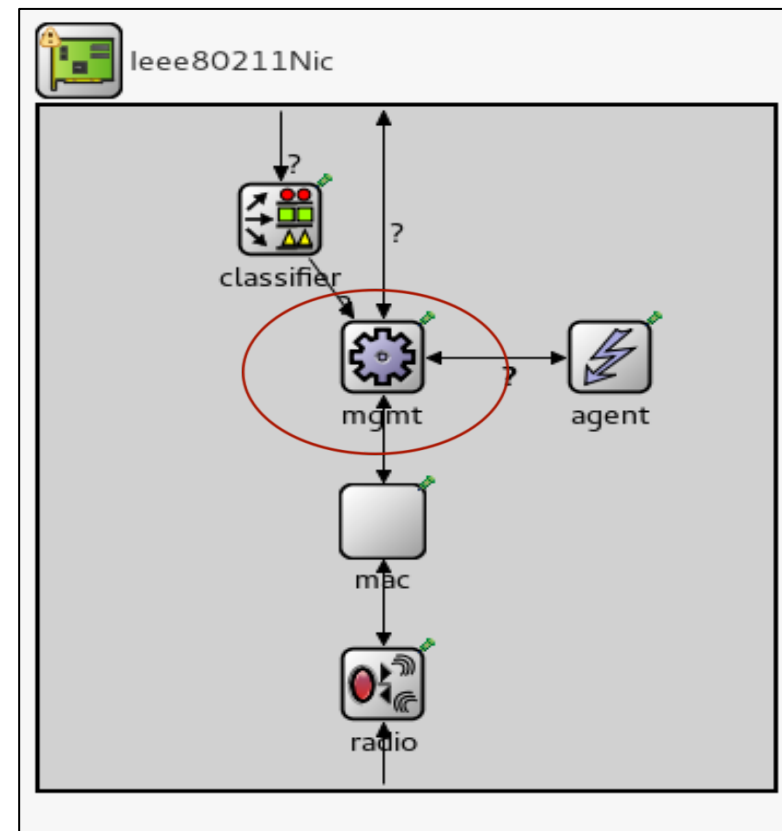

802.11 in INET Framework

- 802.11 network interface card
 - Radio
 - Physical layer
 - MAC
 - CSMA/CA
 - Management
 - Encapsulation/decapsulation
 - 802.11 mode configuration
 - Station (STA) or Access Point (AP)
 - Adhoc mode

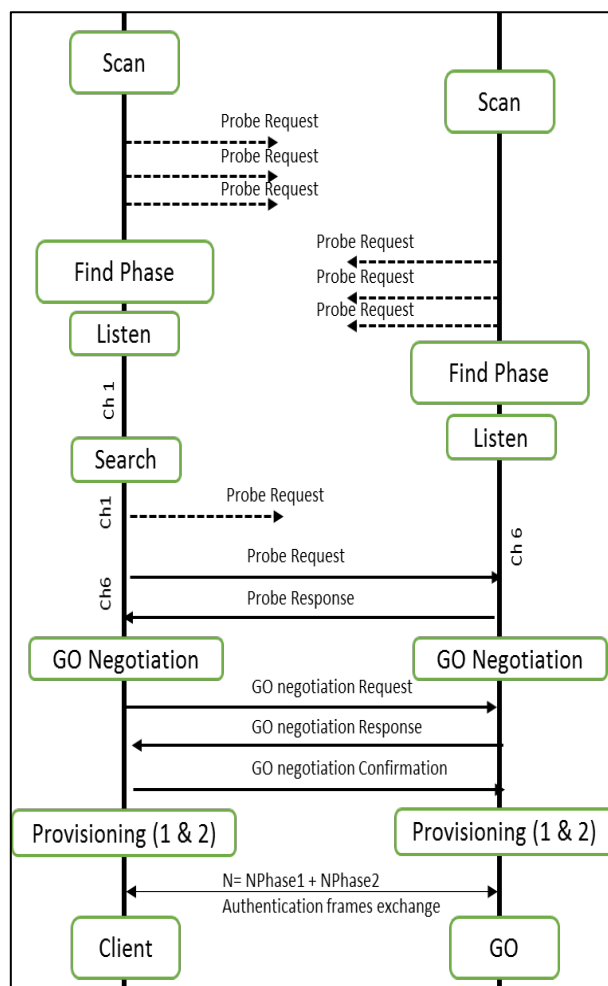

WiFi-Direct implementation (1)

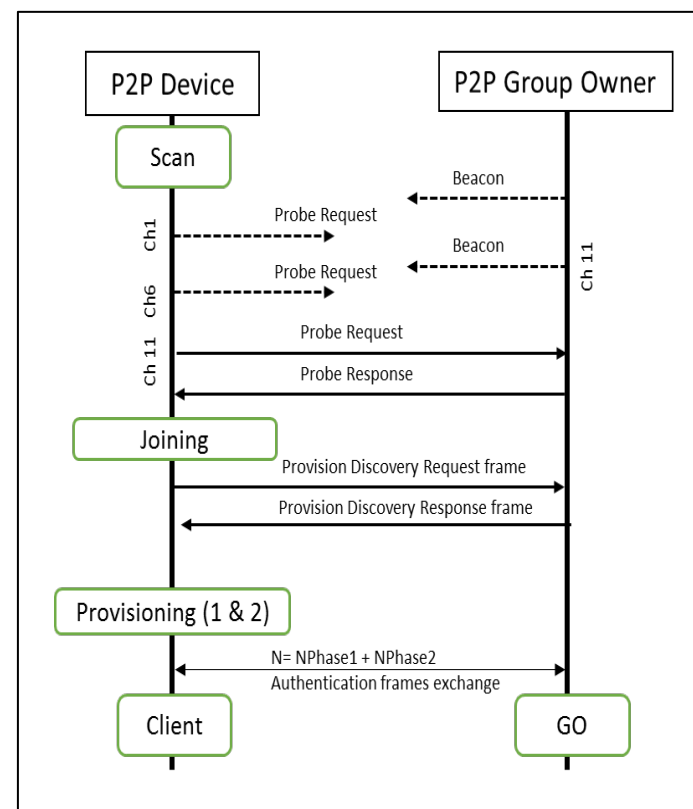

- `.../inet/linklayer/ieee80211/mgmt`
 - Modified
 - `ieee80211MgmtFrame.msg`
 - `ieee80211MgmtBase.cc`
 - `ieee80211MgmtBase.h`
 - New
 - `ieee80211MgmtSTAWifiDirect.cc`
 - `ieee80211MgmtSTAWifiDirect.h`
 - `ieee80211MgmtSTAWifiDirect.ned`
- `.../inet/linklayer/ieee80211`
 - `ieee80211Nic.ned`

WiFi-Direct implementation (2)

Group formation

Group joining

Validation tests

- Topology
 - 3 WiFi-Direct hosts
- Scenario 1 : Standard group formation
 - Stations start scanning
 - Finding a peer
 - GO negotiation between 2 peers
 - One becomes GO
 - The other becomes client
 - GO starts sending Beacon messages
 - The 3rd station joins the group
 - Ping for connectivity test
- Scenario 2: Autonomous group formation
 - GO is assigned by configuration in the .ini file
 - After scanning to detect the presence of GO, other hosts join the group
 - Ping for connectivity test

Scenario 1 : Standard group formation (1)

■ Discovery Phase

host[0] and host[1] discovers each other Discovery time measurement

Scenario 1 : Standard group formation (2)

■ GO Negotiation

```

#288 6.40348094346 host[1] --> host[0] GO Negotiation Request Frame
#288 6.40348094346 host[1] --> host[2] GO Negotiation Request Frame
#301 6.40379541519 host[0] --> host[1] ACK
#301 6.40379541519 host[0] --> host[2] ACK
#316 6.40414941519 host[0] --> host[1] GO Negotiation Response Frame
#316 6.40414941519 host[0] --> host[2] GO Negotiation Response Frame
#329 6.40446388692 host[1] --> host[0] ACK
#329 6.40446388692 host[1] --> host[2] ACK
#374 6.405726554048 host[1] --> host[0] GO Negotiation Confirmation Frame
#374 6.405726554048 host[1] --> host[2] GO Negotiation Confirmation Frame
#386 6.406041025778 host[0] --> host[1] ACK
#386 6.406041025778 host[0] --> host[2] ACK
#414 6.431719516371 host[1] --> host[0] Beacon
#414 6.431719516371 host[1] --> host[2] Beacon

```

- After the Negotiation phase, host[1] becomes GO.

■ Provisioning phase

Scenario 1 : Standard group formation (3)

■ Group joining & connectivity test

#2342	9.531719516371	host[1] --> host[2]	Beacon
#2362	9.548813502304	host[0] --> host[1]	ping9
#2362	9.548813502304	host[0] --> host[2]	ping9
#2375	9.549495974034	host[1] --> host[0]	ACK
#2375	9.549495974034	host[1] --> host[2]	ACK
#2390	9.549949974034	host[1] --> host[0]	ping9
#2390	9.549949974034	host[1] --> host[2]	ping9
#2407	9.550632307598	host[2] --> host[0]	ACK
#2407	9.550632307598	host[2] --> host[1]	ACK
#2422	9.551066307598	host[2] --> host[0]	ping9-reply
#2422	9.551066307598	host[2] --> host[1]	ping9-reply
#2435	9.551748641162	host[1] --> host[0]	ACK
#2435	9.551748641162	host[1] --> host[2]	ACK
#2450	9.552122641162	host[1] --> host[0]	ping9-reply
#2450	9.552122641162	host[1] --> host[2]	ping9-reply
#2465	9.552805112892	host[0] --> host[1]	ACK
#2465	9.552805112892	host[0] --> host[2]	ACK
#2493	9.592844616388	host[1] --> host[0]	ping9
#2493	9.592844616388	host[1] --> host[2]	ping9
#2510	9.593527088118	host[0] --> host[1]	ACK
#2510	9.593527088118	host[0] --> host[2]	ACK
#2525	9.593961088118	host[0] --> host[1]	ping9-reply
#2525	9.593961088118	host[0] --> host[2]	ping9-reply
#2540	9.594643559848	host[1] --> host[0]	ACK
#2540	9.594643559848	host[1] --> host[2]	ACK
#2561	9.631719516371	host[1] --> host[0]	Beacon

- host[2] joins the group
- When host[0] sends a Ping to host[2], host[1] plays the role of Access Point and relays the message.
- When host[1] sends a Ping to host[0], the communication is direct.

Scenario 2 : Autonomous group formation (1)

- host[0] is configured to be GO of the group in the .ini file

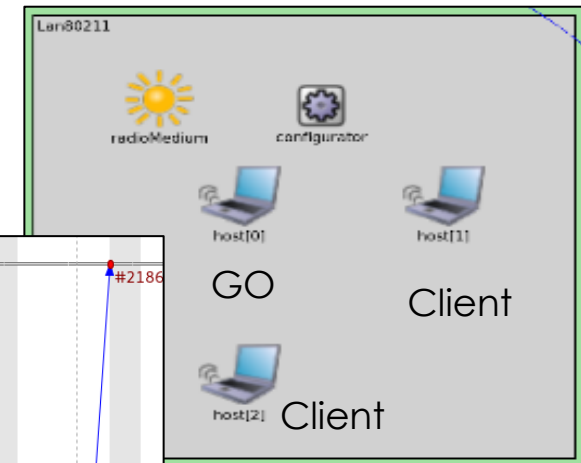

```
# ping app host[0] pinged by Host[1]
**.numPingApps = 1
*.host[1].pingApp[0].destAddr = "host[0]"
*.host[1].pingApp[0].sendInterval = 1s
# ping app host[1] pinged by host[2]
*.host[2].pingApp[0].destAddr = "host[1]"
*.host[2].pingApp[0].sendInterval = 1s
#Configure the P2P Group
**.host[0].wlan[0].mgmt.WiFiDirectUsed=true
**.host[0].wlan[0].mgmt.WiFiDirectGO=true
**.host[0].wlan[0].mgmt.strGroup="Groupe Wifi Direct"

**.host[1].wlan[0].mgmt.WiFiDirectUsed=true
**.host[1].wlan[0].mgmt.WiFiDirectGO=false
**.host[1].wlan[0].mgmt.strGroup="Groupe Wifi Direct"

**.host[2].wlan[0].mgmt.WiFiDirectUsed=true
**.host[2].wlan[0].mgmt.WiFiDirectGO=false
**.host[2].wlan[0].mgmt.strGroup="Groupe Wifi Direct"
```

Scenario 2 : Autonomous group formation (2)

- When host[2] pings host[1], the GO (host[0]) plays the role of AP and relays the message

Conclusion

- WiFi-Direct is a new communication mode for 802.11 networks and widely used by smartphones or tablets
- We have implemented the WiFi-Direct protocol in the INET framework of OMNeT++ following the Technical Standard Specification defined by Wi-Fi Alliance
- This implementation can be used for research on protocol design and performance evaluation of WiFi-Direct based networks (e.g. Device-to-Device dense wireless networks)

Thank you !
